

# Connecting your TV to the Internet

## **1. The wireless option – connect over your home Wi-Fi**

Most new Smart TVs are Wi-Fi-enabled, meaning they have a wireless adapter built-in. Connecting to the web takes just a few minutes – but this option works best when your TV is in the same room as the router.

### **Benefits of a wireless connection**

- There are no trailing wires – perfect for keeping your living room uncluttered
- You have the freedom to place your TV anywhere in your living room, which makes it the best option for wall-mounting
- It's incredibly simple to set up – simply press a few buttons on your TV remote

### **How to connect**

- Hit the **Menu** button on your TV remote
- Choose the **Network Settings** option then **Set up a wireless connection**
- Select the wireless network name for your home Wi-Fi
- Type your Wi-Fi password using your remote's button.

## **2. The wired option – plug directly into your router**

Want the strongest, most stable connection? Plug your TV directly into the internet router via an Ethernet cable. Your TV must be close to your router.

### **Benefits of a wired connection**

- It's simple to set up – just plug it in
- It provides the most reliable connection – your streaming should be free from buffering
- It's much faster than Wi-Fi

### **How to connect**

- Find the Ethernet port on the back of your TV or Roku
- Connect an Ethernet cable from your router to the port on your TV
- Select **Menu** on your TV's remote and then go to **Network Settings**
- Select the option to enable wired internet
